S.Genç

CTIS 256

Midterm 1

Duration: **110** minutes

Question 2 (40Pts): Write a sticky web form (**q2.php**) that calculates the conversion of currencies to Turkish Lira. The currencies are stored in **$xrates** array in ***db.php***. The currency listbox should be rendered dynamically (using $xrates array). The textbox (amount) is used to get the amount of the selected currency. "Convert" is a submit button. If the amount is not a number or a negative value, it gives an error message in red like "Invalid Amount", otherwise it converts to TL and displays in big font size and blue.

It always remembers the submitted values in textbox and listbox. Just validate amount.

Do not forget to watch "***q2.mp4***" that demonstrates what you are supposed to do. You are NOT allowed to use Javascript.

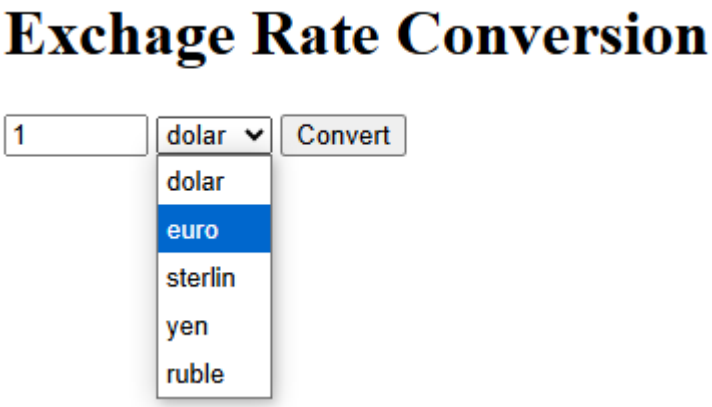

Fig 2 : Web Form for the conversion

Grading:

- (**10Pts**) Dynamic currency listbox
- (**10Pts**) Calculate and display the conversion if there is no error.
- (**10Pts**) Sticky web form (remember the submitted values)
- (**10Pts**) Validate "amount" only, and show error message if it is invalid.

- Good Luck -
